

QNS-CD-1.0 Quantum Node Signal Coding Design

Author: Aziel Eliab only

Parents: QNS-WP-1.3 / QNM-BUILD-1.0 / AIH-WP-1.3 / APG / AZPIPE / ChainLock

This PDF is the print companion of docs/QNS-CD-1.0.md.

The markdown is the law. The Worker does not serve this file.

Photon is the packet. QNS is the native medium. Light is camera-flash OCC.

Every send class lives in one local qnsd program.

Restriction walks the next class. Packet id does not change across hops.

VIA_ORDER = lan, plc, bt, rf, light, qns, operator, local

local + qns + operator always PRESENT. rf / plc / light need declare.

API binds 127.0.0.1 only. Sticky-via banned. SEAL independent of OS BT/Wi-Fi.

PHOENIX-LOCK waits / re-seals locally after poison or isolation.

Phoenix does not restore a public hostname. Public tunnels die with the pull.

Anon-broadcast stays loopback sibling. GET /v1/mesh never enables. No Node Gate.

Suite Workers cite/proxy only. Not a Softwares-tab product.

Apache-2.0. Forks are welcome and always allowed.
